🌿 1. What Is Xanax and Why Is It Prescribed?

Xanax (Alprazolam) is a benzodiazepine medication prescribed to treat:

- Generalized Anxiety Disorder (GAD)
- Panic Disorder
- Short-term anxiety related to stress or depression

It works by boosting GABA neurotransmitter activity, which calms overactive brain signals responsible for anxiety. With consistent, doctor-supervised use, Xanax can significantly improve focus, confidence, and emotional balance — providing the rapid relief many patients urgently need.
